1)

$h_{cg} = 2ft + \frac{4ft}{2} = 4ft = 1.2192\,m$

$F_{CG} = P_{CG} \cdot A$

$F_{CG} = (h_{CG} \cdot \gamma_w) \cdot (L \cdot H)$

$F_{CG} = \left(1.2192\,m \cdot 9.8\,\frac{kN}{m^3}\right)(1.25\,m \cdot 1.2192\,m)$

$\boxed{F_{CG} = 17.5\ kN}$

2) Posición del centro de presión (CP)

Para un rectángulo $I_{xy} = 0$

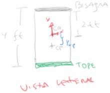
$\Rightarrow \boxed{x_{cp} = 0}$

$I_{xx} = \frac{ab^3}{12}$

$$\Rightarrow Y_{cp} = -\gamma_w \sin\theta \frac{\frac{ab^3}{12}}{F_{CG}}$$

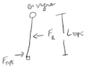
$$Y_{cp} = -\left(9.8\left[\frac{kN}{m^3}\right] \cdot \sin(90)\right) \cdot \frac{\frac{(1.25)(1.2192)^3}{12}\,[m^4]}{17.5\,[kN]}$$

$$\boxed{Y_{cp} = -0.106\,m}$$



Para calcular la fuerza sobre el tope debemos hacer balance de momentum angular

$$\sum M_{Bisagra} = \tau_{Tope} - \tau_R = 0$$
$$= F_{Tope} \cdot L_{Tope} - F_R \cdot L_R$$



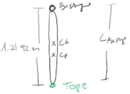
$$0 = F_{Tope} \cdot (4ft) - 17.5\,kN\left(\frac{4}{2}ft + |-0.106|\right)$$

$$0 = F_{Tope}\,(4ft) - 17.5\,kN\,(2ft + 0.106\,m)$$

$$F_{Tope} = \frac{17.5\,kN\left(\frac{1.2192}{2}\,m + 0.106\,m\right)}{1.2192\,m}$$

$$\boxed{F_{Tope} = 10.3\,kN}$$

Fuerza en la bisagra

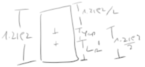


$$\sum M_{Tope} = 0$$

$$0 = \tau_{Bisagra} - \tau_R$$

$$0 = F_{Bisagra} \cdot L_{Bisagra} - F_R\,L_R'$$

$L_{Bisagra} = 1.2192$



$$L_R' = \frac{1.2192}{2} - |y_{cp}|$$

$$L_R' = \frac{1.2192}{2} - 0.106\,[m]$$

$$F_{Bisagra} = \frac{F_R \cdot L_R'}{L_{Bisagra}} = \frac{17.5\,[kN]\left(\frac{1.2192}{2} - 0.106\right)[m]}{1.2192\,[m]}$$

$$\boxed{F_{Bisagra} = 7.2\,[kN]}$$
